

HDB RESALE MARKET – MEETING THE NEEDS OF MANY

When the second quarter HDB resale data was released, resale flat prices were seen rising 3.1% for that period, a pick-up from the 1.6% increase in 1Q2011. Cash-over-valuation (COV) was up, for almost all locations and room types, a reversal from the general downtrend for the first three months of the year. In August 2010, the Government had put in place measures to cool the HDB resale market and more recently it announced raising BTO flats availability to 26,000 in 2011 and revising the monthly household income ceiling from \$8,000 to \$10,000.

Rising cash-over-valuation in 2Q2011

Since rising COV is of great interest to the market, it will be the main subject of our discussion in this commentary. We recognize the limitations of analyzing the COV based on median data (as provided by HDB) but it should be adequate in helping us in our broad analysis. We will also centre our attention on three, four and five-room flats since they account for 90% of HDB resale transactions. The table below provides the COV for each room-type by location as well as the percentage change over the COV of the previous quarter. It is noted that COV rose for almost all room-types in all locations.

The most robust COV increases are attributable to five-room flats which registered increases of 40% or above for 18 of the 26 new towns. 16 new towns saw COV increases of 40% and above for their four-room flats while the same phenomenon was observed in 14 new towns for three-room flats. In terms of absolute median COV, five-room flats lead the pack again with 15 new towns having COV of \$40,000 or higher. Only 1 new town had three-room flats with median COV above \$40,000 while 7 new towns recorded that level of COV for their four-room flats. These observations confirm the notion that buyers of larger flats are financially better off, being able to pay higher COV. On average, COV appears to have risen 40% to 50% in 2Q2011.

New towns that experienced strong COV increases for all the three flat types include Bukit Batok, Bukit Panjang, Clementi, Jurong East, Jurong West, Tampines and Woodlands. For example the COV increases for three, four and five-room flats in Bukit Panjang were 72%, 60% and 75% respectively. Geylang recorded the strongest COV increase for five-room flats with a 112% rise over the previous quarter (omitting other locations with higher increases but with few transactions and therefore unlikely to be representative). In the case of four-room flats, Queenstown posted the strongest COV increase at 76% while the

steepest increase for three-room flats at 72% was seen in Bukit Panjang.

Woodlands new town was the most active resale market in the second quarter with 562 resale approvals. It is an example of a new town where median prices are relatively low but COV increases fairly robust. Its five-room flats had a median price of \$420,000 but a COV increase of 87%. Four-room flats in this new town recorded a median price of \$368,000 while its COV increase was 56%. The other new towns with considerable resale market activity (based on resale approvals) in 2Q2011 include Jurong West (494), Tampines (392), Sengkang (387), Yishun (362) and Hougang (328).

Median COV for 2Q 2011

Town	3 Room		4 Room		5 Room	
	2Q 2011	Change from 1Q 2011	2Q 2011	Change from 1Q 2011	2Q 2011	Change from 1Q 2011
Ang Mo Kio	\$25,000	58%	\$30,000	30%	\$40,000	22%

Note: Some extraordinary increases in COV may not be representative due to limited number of transactions

Meeting the Needs of Many

The Government has explained that rising HDB resale flat prices and COV are due to an imbalance in supply and demand. According to our analysis, this imbalance is due to several factors. The factors contributing to demand for HDB resale flats are:

- Owners of private residential properties have been buying HDB resale flats and retaining their private homes but this has been addressed by the measures of August 2010 which prohibit buyers of resale flats to concurrently own a private property during the minimum occupation period (MOP). This would have discouraged owners of private properties who were not prepared to dispose of their private homes after buying a HDB resale flat.
- Permanent residents (PRs), especially those who find private homes too expensive will turn to the HDB resale market. The August 2010 measures also require PRs to dispose of their private property in their previous domiciles if they buy a HDB resale flat. It acted as a deterrent to those who were reluctant to give up their private property.
- Many first-timers resort to buying HDB resale flats because they could not qualify for new HDB flats, having exceeded the income ceiling or found the waiting time for new flats too long, amongst other reasons. The Government is now tackling these issues by increasing the supply of new BTO flats and raising the income ceiling. A higher income ceiling will enable more buyers to qualify for new HDB flats and an increased supply would reduce waiting time.
- Private property owners downgrading to HDB resale flats who find HDB resale flat prices and COV affordable
- HDB flat owners upgrading/downgrading to bigger or smaller resale flats contributing to the churn within the HDB resale market
- Tenants comprising of foreigners, PRs and locals who rent HDB flats or rooms, making it attractive for the owners to continue retaining their flats

Factors affecting supply of HDB resale flats include:

- The supply of HDB resale flats depends on the amount of new supply being added onto total stock of HDB flats. In the last 5 years (2006 to 2010) the new supply had decreased to an average of 5,500 units per annum which is significantly lower than the average of 11,000 units per annum between 2001 and 2005 and 31,600 units per annum between 1996 and 2000. This anomaly would eventually be addressed by the increase in new flat supply but the Government has explained that it may take a few years for the imbalance to be resolved.
- High private property prices as well as the 60% loan limit for buyers who have one or more outstanding housing loans has made it more difficult for some HDB owners to upgrade to private housing or another HDB flat, thus postponing the sale of their existing unit
- A growing trend amongst HDB owners in retaining their HDB homes after completing their MOP and buying a private property for investment instead.
- Those who already concurrently own a HDB flat and private property would not dispose of their HDB flat because they would be caught by the latest rules on concurrent ownership if they decide to buy a HDB flat again

The HDB resale market is indeed catering to the needs of many. Sandwiched between new HDB flats at the lower end and private residential properties at the upper end, it remains the only affordable housing option of many, especially taking into account that 82% of the population has to resort to HDB flats for accommodation. The HDB resale market will continue to be underpinned by these factors but some mitigation is likely, arising from the eventual revised income ceiling, the increased availability of new flats and a possible moderation in demand if the economy slows. Given the current situation of firm resale prices and COV, first-timers should ideally steer towards new BTO flats now that availability of such flats has increased. Other potential buyers of resale flats may do well to delay their purchase if their needs are not pressing as prices and COV should ease eventually due to the reasons mentioned above.
